User Guide

Contents

This guide explains how this repository is organized and how to maintain this resource.

Resources Organization

This repository is organized as follows

path	description
`.github`	Templating files used by github
`code`	code examples
`docs`	additional helpful documents
`img`	all images
`labs`	lab exercises
`lectures`	lecture notes
`problems`	practice problems
`templates`	templates and meta data files used for building this resource
`index.md`	website index page

Additional configuration files are at the root of this repository.

Locating course resources

The latest compiled version of all course resources is available on the accompanying website[1]. This website includes the course textbook in all supported formats, links to labs, and all other available student resources.

Earlier versions of course material can be found under releases[2].

Editing Resources

Creating new lectures

When creating a new lecture, let's call it `lecture xyz`:

1. first create a directory called `lecture_xyz` under `lectures` directory

   Following the existing pattern for naming convention which is lowercase and separation by underscores.

2. under that directory, create an `readme.md` (lowercase)

   Here we use filename readme as it works nicely with Github. The build system will look for files matching this pattern. Pandoc appears to use a case-insensitive match pattern, at least currently, but to be safe use lowercase convention when naming this file to match the expected pattern[3].

Following these steps will automatically include the new lecture in the book.

Do not include meta section in individual lecture files because these lectures will be concatenated by pandoc into single larger document. Any meta data in individual files would appear somewhere in the middle of the larger document, and as such will not be treated as front matter.

Creating new labs

☐ TODO

Content Labelling

Course resources are labelled with emoji shortcodes or text labels.

Each resource should, at minimum, list its prerequisites and security-related label.

Labelling with shortcodes

Use of emoji shortcodes to label course resources

[1] https://csci-1301.github.io/

[2] https://github.com/csci-1301/csci-1301.github.io/releases

[3] https://github.com/csci-1301/csci-1301.github.io/blob/d0cca5dfab111ed9148256992b63fbed9c05b880/Makefile#L14

Description	Shortcode	Icon
Security related aspects will be labelled as “security”	`:lock:`	
Optional parts will be labelled as “optional”	`:question:`	
Examples of common pitfalls	`:warning:`	

Labelling using text labels

1. Each resource will be labelled with prerequisites.

   This is a list of zero or more values. For zero prerequisites we write `None`. These requirements are expressed in the associated index of lectures/labs/problems (example[4]).

2. Lecture notes and slides will be labelled by related labs, and vice versa

   These requirements are expressed in the associated index of lectures and labs (example[5]).

Styling and Templating

Templating files are under `templates` directory.

Repository Maintenance

This repository uses following tools and technologies

- git - version control
- Github - to make source code available on the web
- markdown, LaTeX - for writing the resources
- pandoc - for converting documents to various formats
- make, bash - to specify how to build this resource
- travis-ci - to automatically build the resource
- github pages - to serve the accompanying website
- additional packages for specific tasks: texlive, Pygments, pandoc filters, etc.

Building the resource locally

It is generally not necessary to build this resource locally unless you want to see what it will look like in advance or when making changes to the build system.

Install required dependencies

To find the current list of dependencies needed to build this resource, refer to the build script install section[6] which lists all required packages need to build the

[4] https://github.com/csci-1301/csci-1301.github.io/tree/main/lectures
[5] https://github.com/csci-1301/csci-1301.github.io/tree/main/lectures
[6] https://github.com/csci-1301/csci-1301.github.io/blob/main/.travis.yml

resource. The exact installation steps vary depending on your local operating system.

In general the following dependencies are needed:

- pandoc
- LaTeX
- make
- python 3.+
- pandoc filters: Pygments, include-code

Running the build

After installing all dependencies, from the repository root, run:

```
make all
```
